

Summer RAID '24

Project Proposal

Project Title

1. Personal Information

- Name - Debjit Ghora
- Roll No. - B23ME1018
- Email Id - b23me1018@iitj.ac.in
- Phone No. (Whatsapp No) - 7859806554
- GitHub ID - CODEsane04
- Technical Skills - C, C++, Python, Beginner at DSA (solved roughly 100 questions),

2. Implementation Details

Step 1 - Setting a goal

We need to set a goal based on which we will be laying the foundations for building the SLM. Our goal could be recognition of objects or parameters based on the domain, or General question answering model (kind of chatGPT in a specific domain), etc.

Step 2 - Collecting Data

This step should not only consist of collecting the data, but it should in its own be a step by step process of :-

- Identifying sources
- Ensuring the volume of data
- Refining the data to eradicate duplicates, errors & irrelevant information

Data must be collected from the specific domain and from reliable sources, the volume of data must be high enough to properly train the model, The data must be refined so as to get as accurate results as possible.

Step 3 - Selection of model

Required model must be selected based on the purpose of the model.

Step 4 - Training the model

If the training has to be done from scratch, it first has to be pre-trained with a larger collection of written or spoken text (a.k.a large corpus of data), so that it learns basic language patterns.

we'll then proceed to train the model with better and specific data sets while we keep testing it based on different parameters.

Step 5 - Optimisation of our Model

Optimizing our model based on various parameters.

Step 6 - Deployment

Package the model for Deployment, and make sure it is easy to integrate it in the application.

Develop API's or Interfaces to interact with the model.

Final Testing in a real world environment to ensure its accuracy and work rate during practical applications.

Step 7 - Maintenance

We need to keep updating the model with the new and improved sets of data so that our model could stand the test of time and could provide more accurate results.

3. Timeline Details of Your Implementation

Provide a detailed timeline outlining each phase of your project. Include key milestones and deliverables for each phase.

- Identifying the domain - 1-2 days
- Data collection & preparation 1-2 weeks
- Tokenization - 1 week
- Model creation & training - (4-5 weeks)
- Evaluation of Performance - (1 week)
-

4. About Yourself

I have a keen interest in learning AI and using it to build projects for enhancing my learning, so that one day I can contribute to the greater good.

5. Experience

Although I don't have a prior experience on building projects in the field of AI and Data Science, but Since it's will be my first project, I am very excited to embark on this journey full of learning and improving my skills

6. Your Prior Commitments/Availability Details

Learning Tech stack for ML and basics of ML in the summers, and continuing on working on my web development skills.
